The dangers of using Seasonal Adjustment and other filters in Econometrics

Some economic and environmental examples

1 Introduction

- When using seasonally unadjusted data, how can we decide what is the optimal seasonal adjustment to use?
  - Not theoretical point of view
- Do we have sensible statistical tools to discriminate among the different available alternatives?
- Knowing that the *estimated* components are not *observable*, is it enough to pay attention to just the component of interest and forget about the remaining ones?
- Is the ideal property of *orthogonality* among the different component reasonably fulfilled?
- How potential *outliers* and other variants of *intervention* analysis affect final estimated components?

2 Traditional approach

$$y_t = T_t + C_t + S_t + \varepsilon_t$$

3 Small empirical exercise

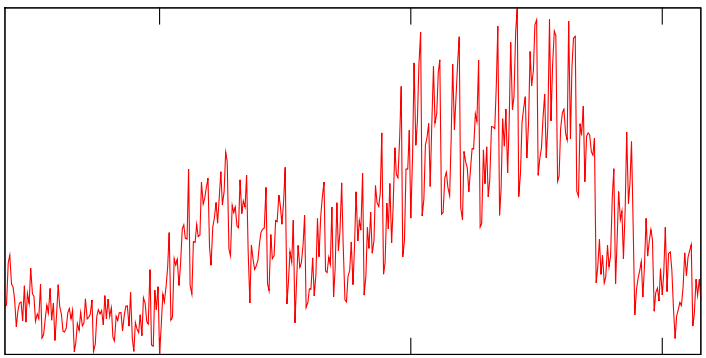
Four monthly time series pertaining to the Spanish economic CLI used in: http://uam-ucm-economic-indicators.es/

- CAR REGISTRATIONS
- HOUSING STARTS
- CEMENT CONSUMPTION
- TRUCKS

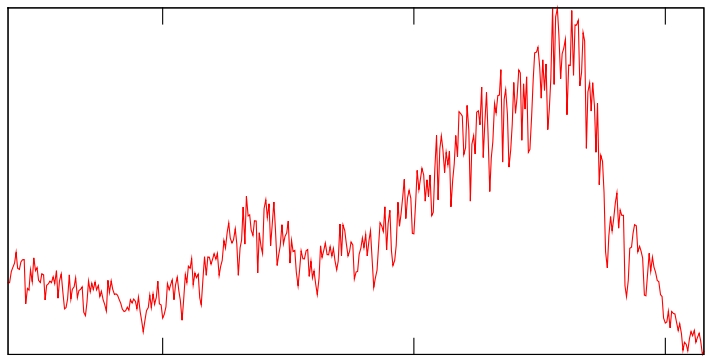
From 1978M01 to 2013M12

4 Small empirical exercise

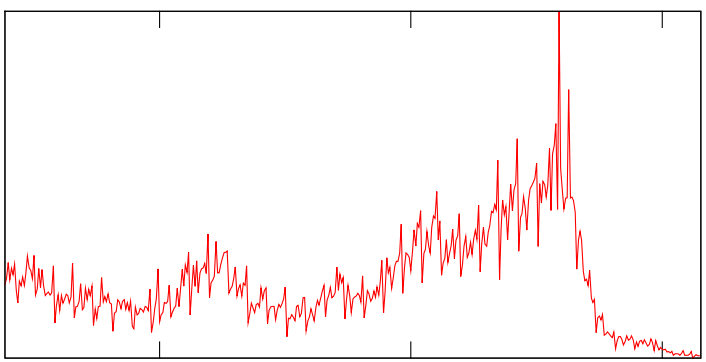
CARS



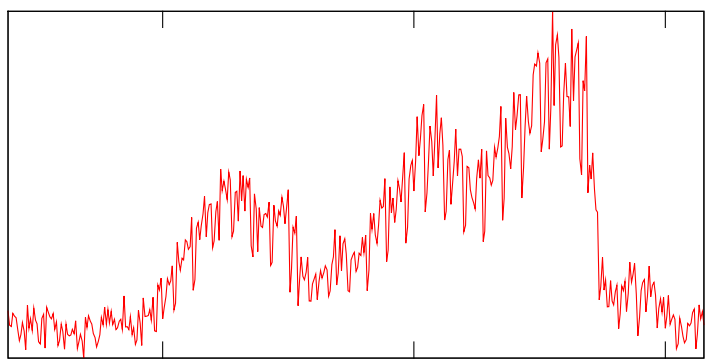
CEMENT



HOUSES



TRUCKS



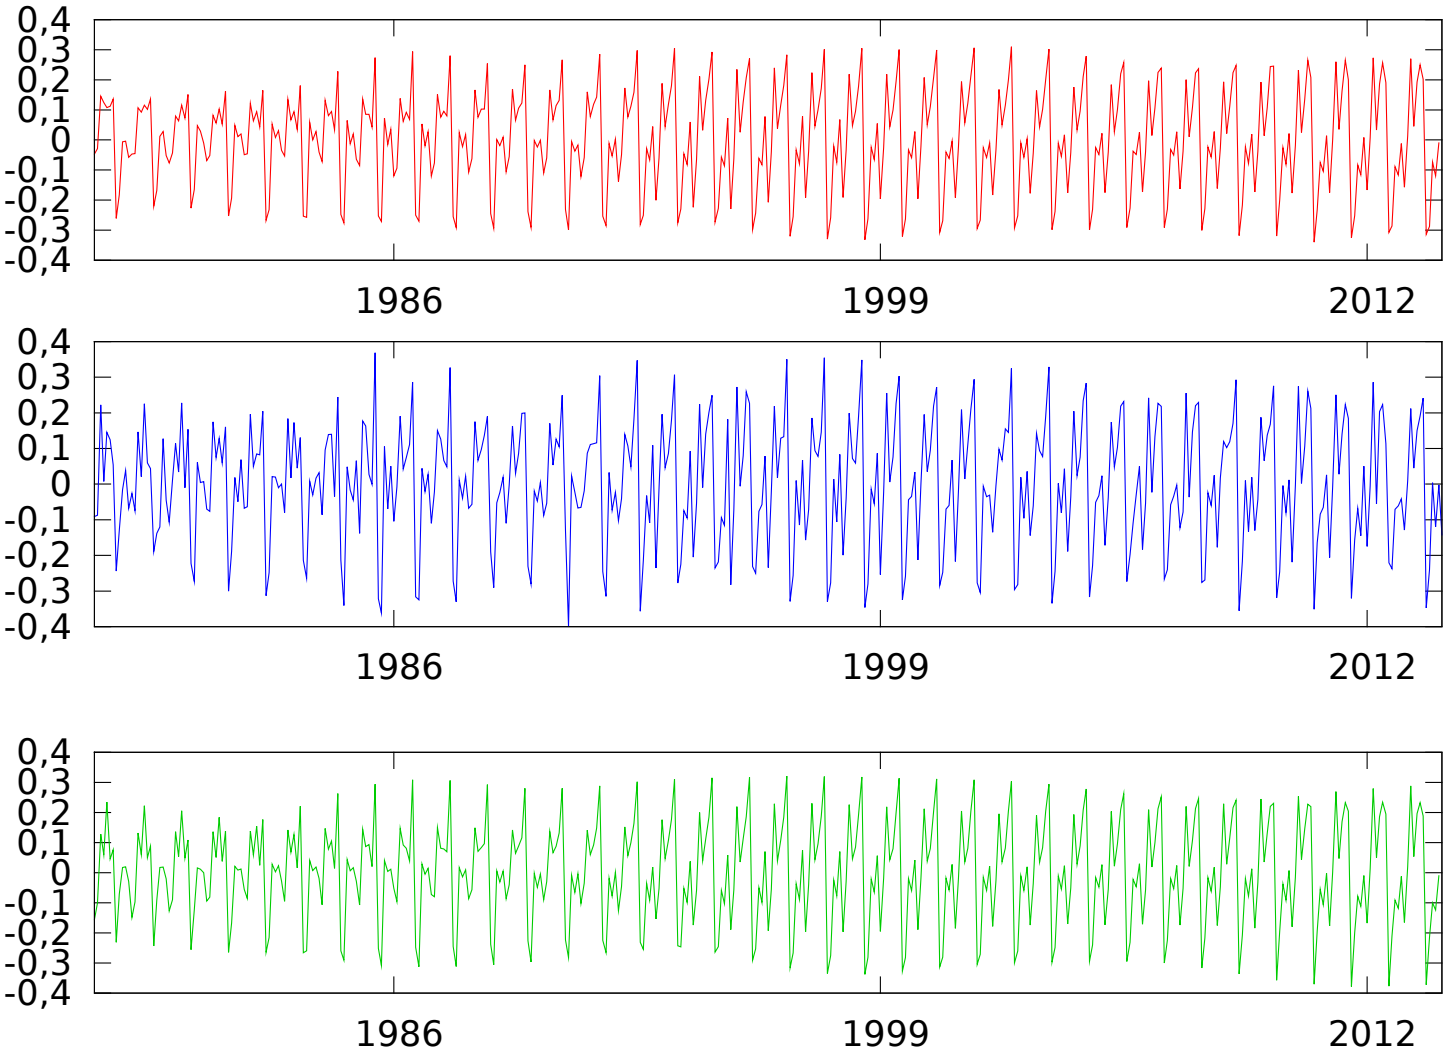
5 Several signal extraction methodologies

Using several model-based signal extraction methodologies, namely

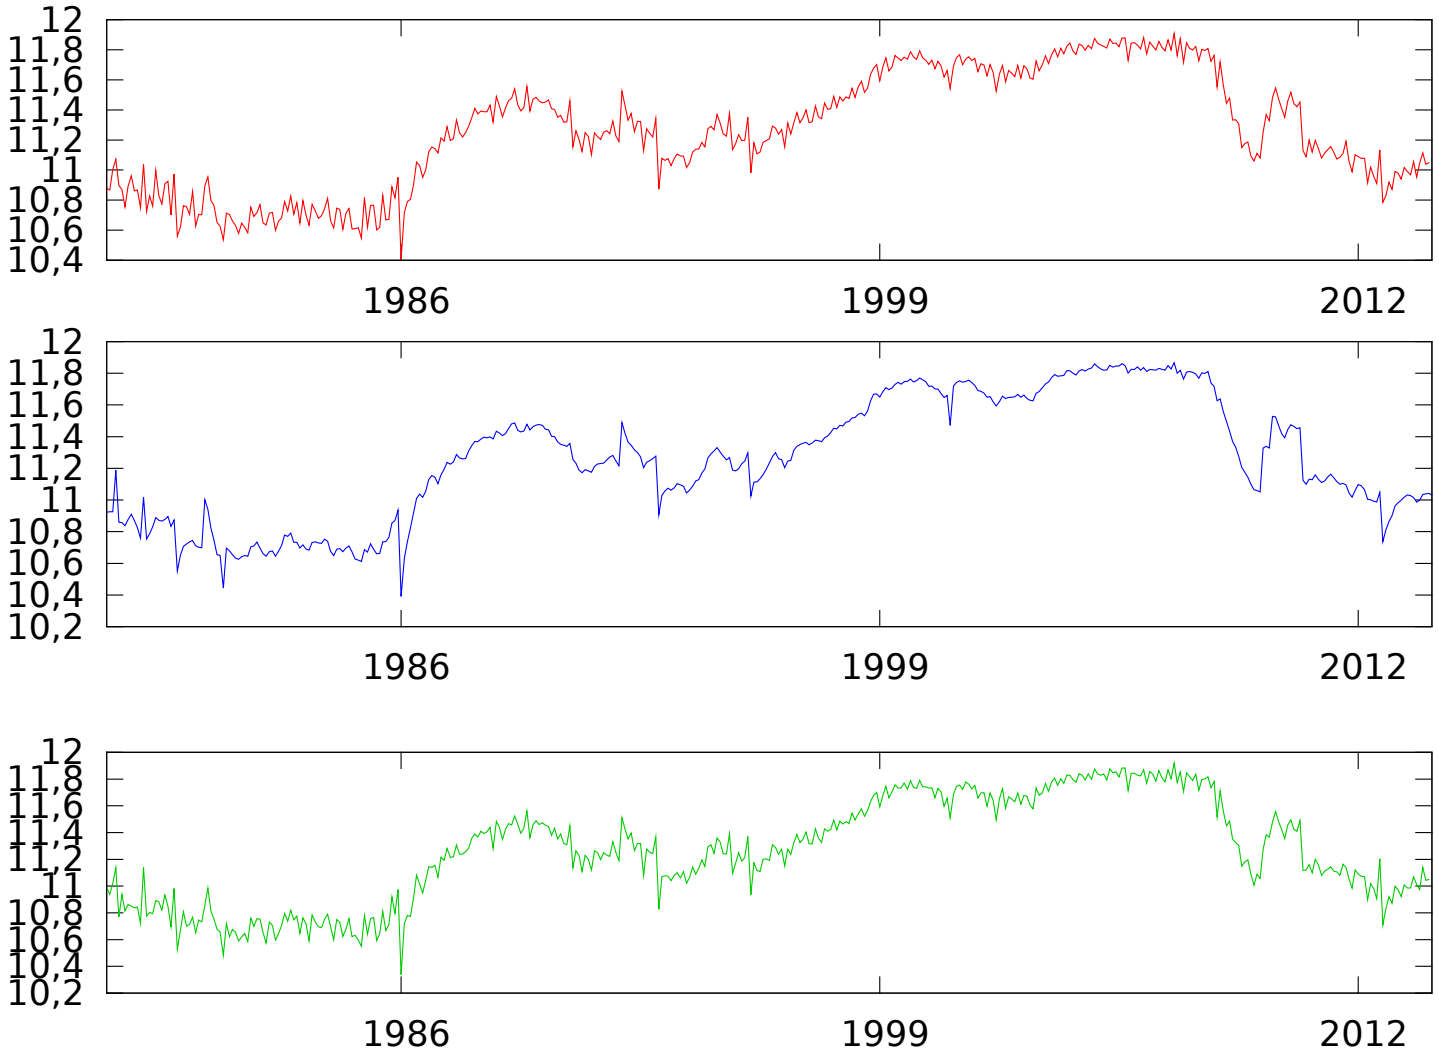
- SEATS-TRAMO
- X-12 ARIMA
- Linear Dynamic Harmonic Regression (Bujosa et al., 2007)

Disclaimer and explanation of the posterior empirical results

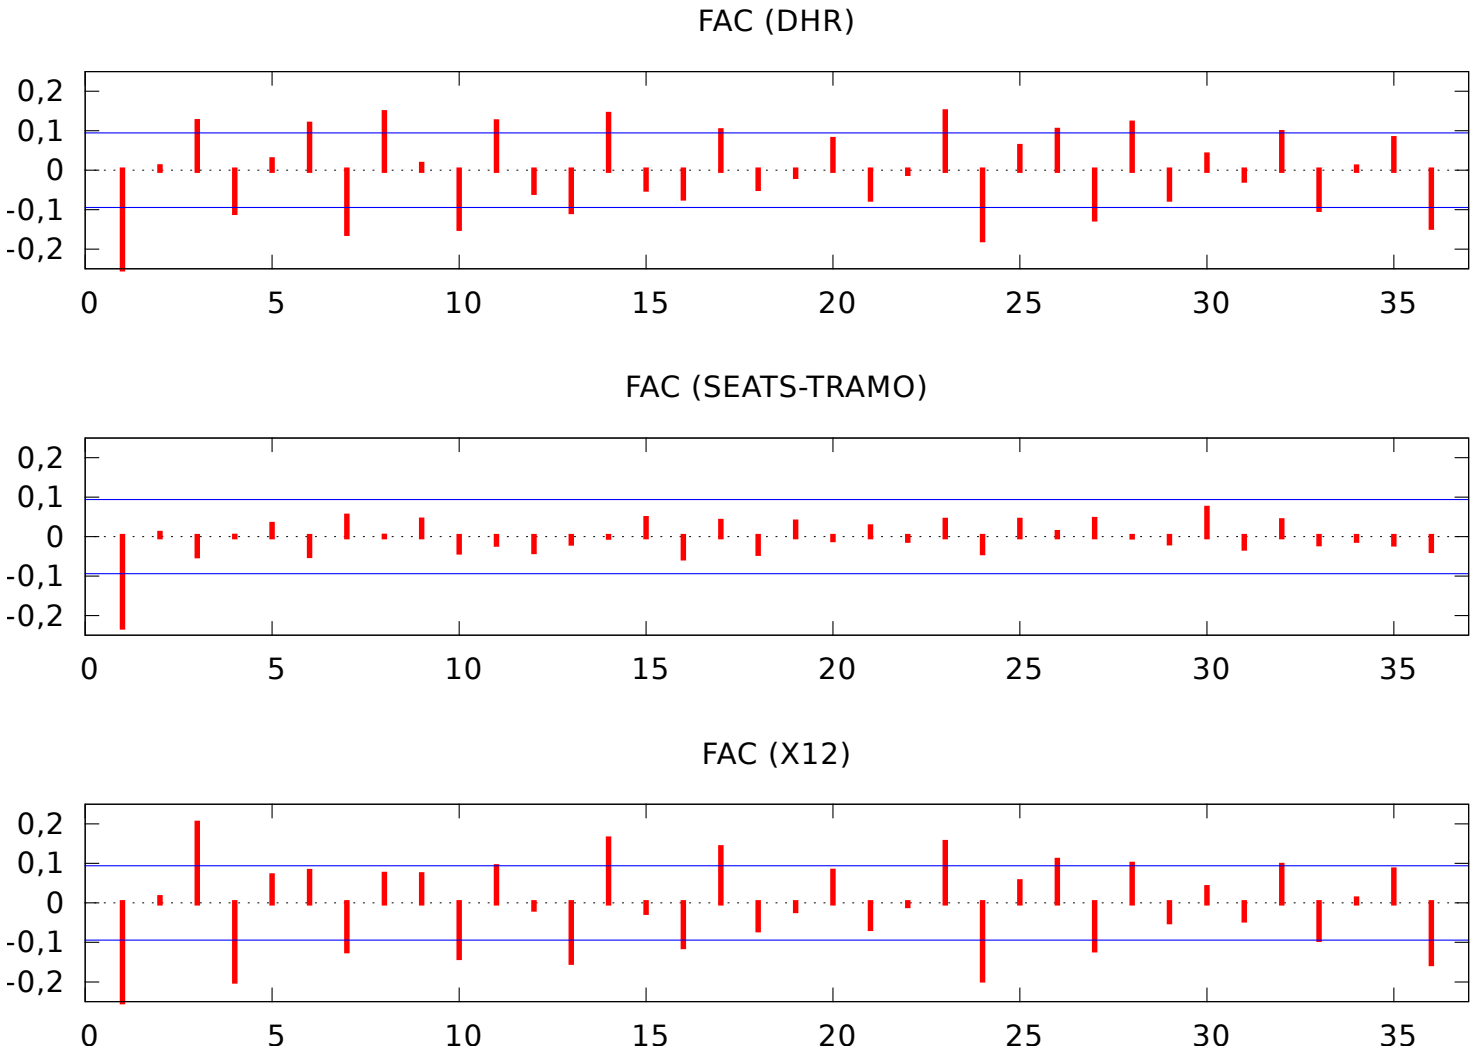
6 Car registrations Seasonal Factors: DHR, ST, X12



7 Seasonally adjusted Car registrations: DHR, ST, X12



8 FAC – First Difference of Seasonally adjusted Car registrations



9 Summary of tentative results of the four series

- Outlier detection plus other interventions as easter effects and calendar effects are crucial in the estimation of unobserved components models

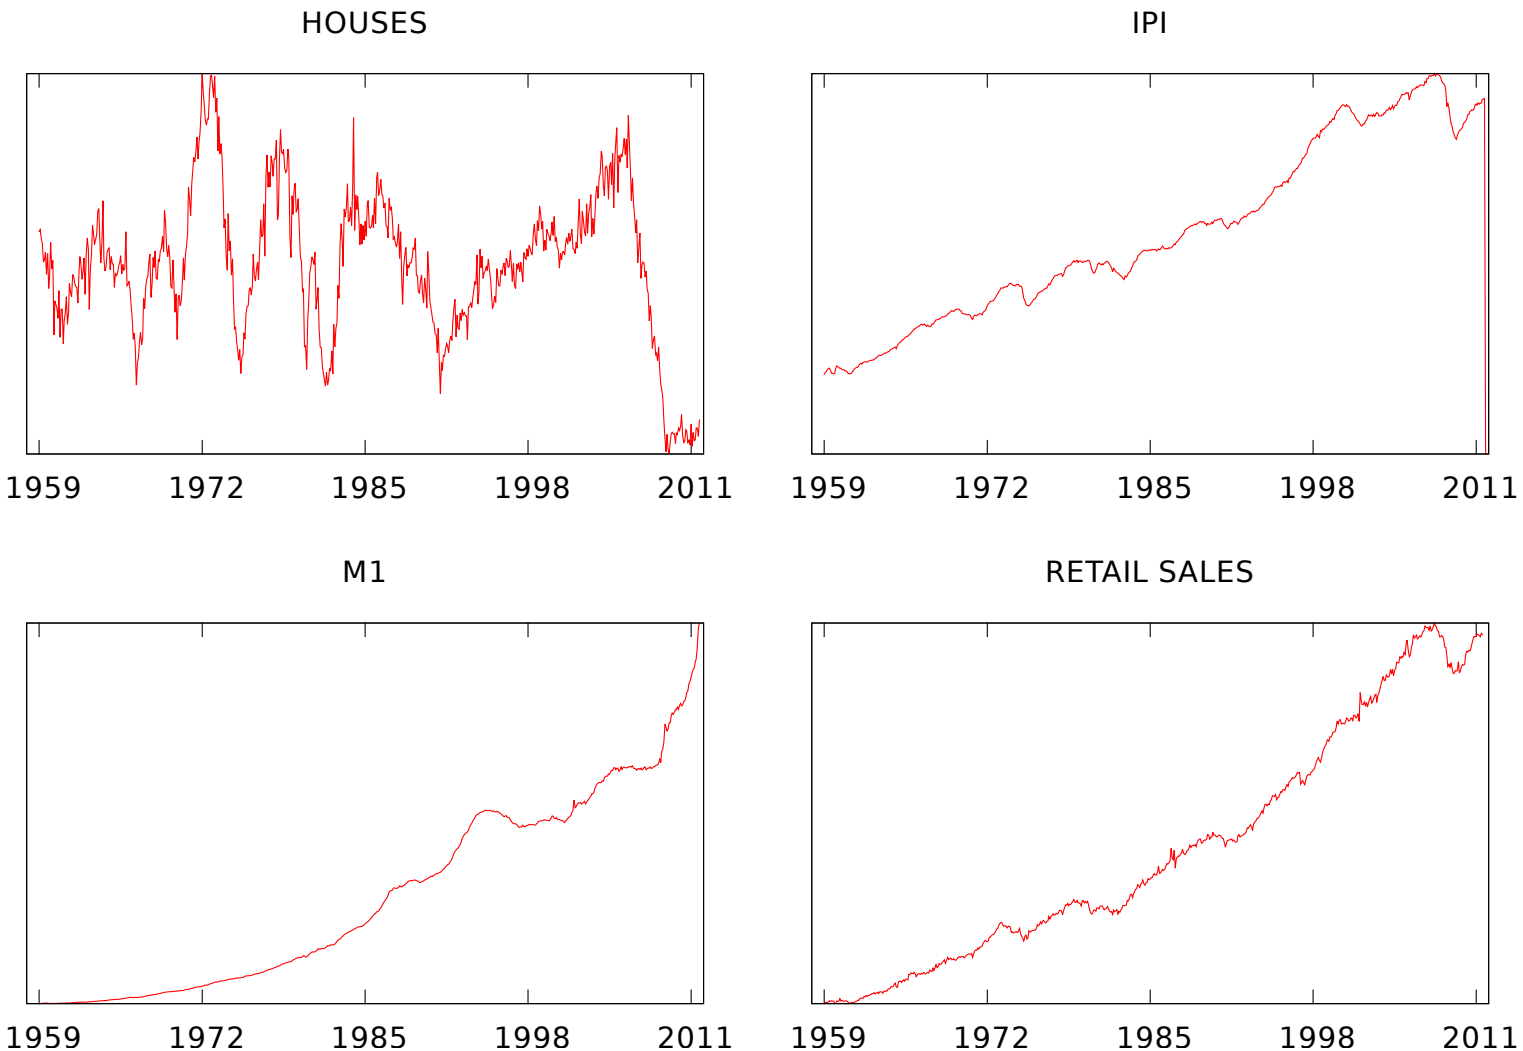
- As a matter of fact when you don't use this option in SEATS-TRAMO there is evidence of seasonality in the SA series

- Using outlier detection plus easter and calendar effects produce considerable reduction in the estimated residual variances ranging from 21% to 31%

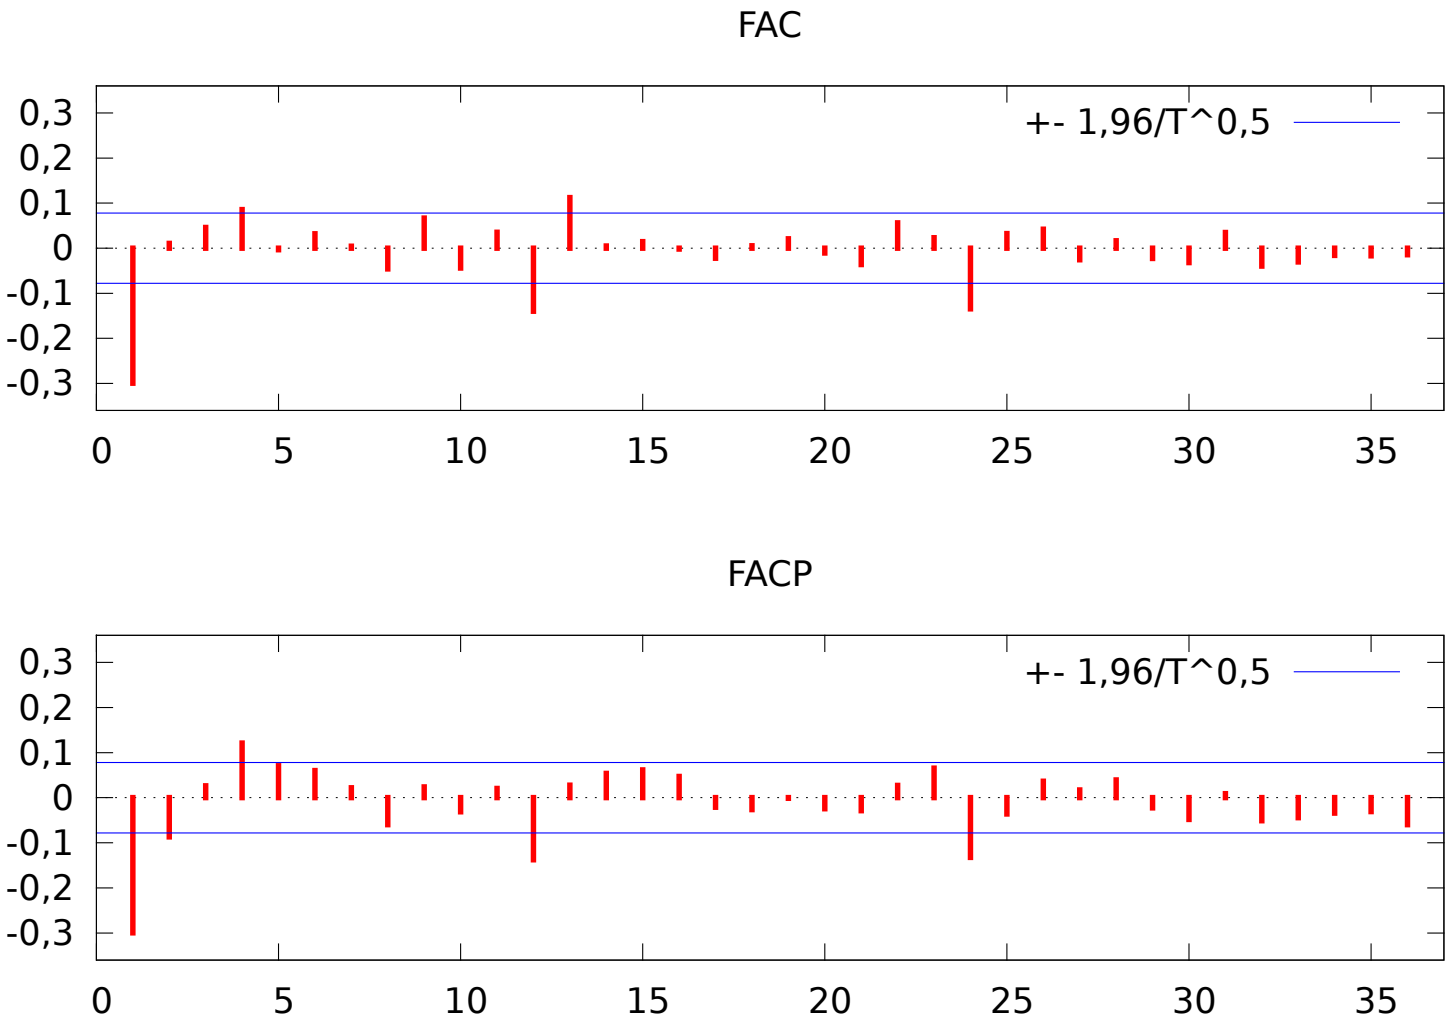
10 Results from a Stock & Watson data base

- Housing starts
- IPI
- Money supply – M1
- Retail sales

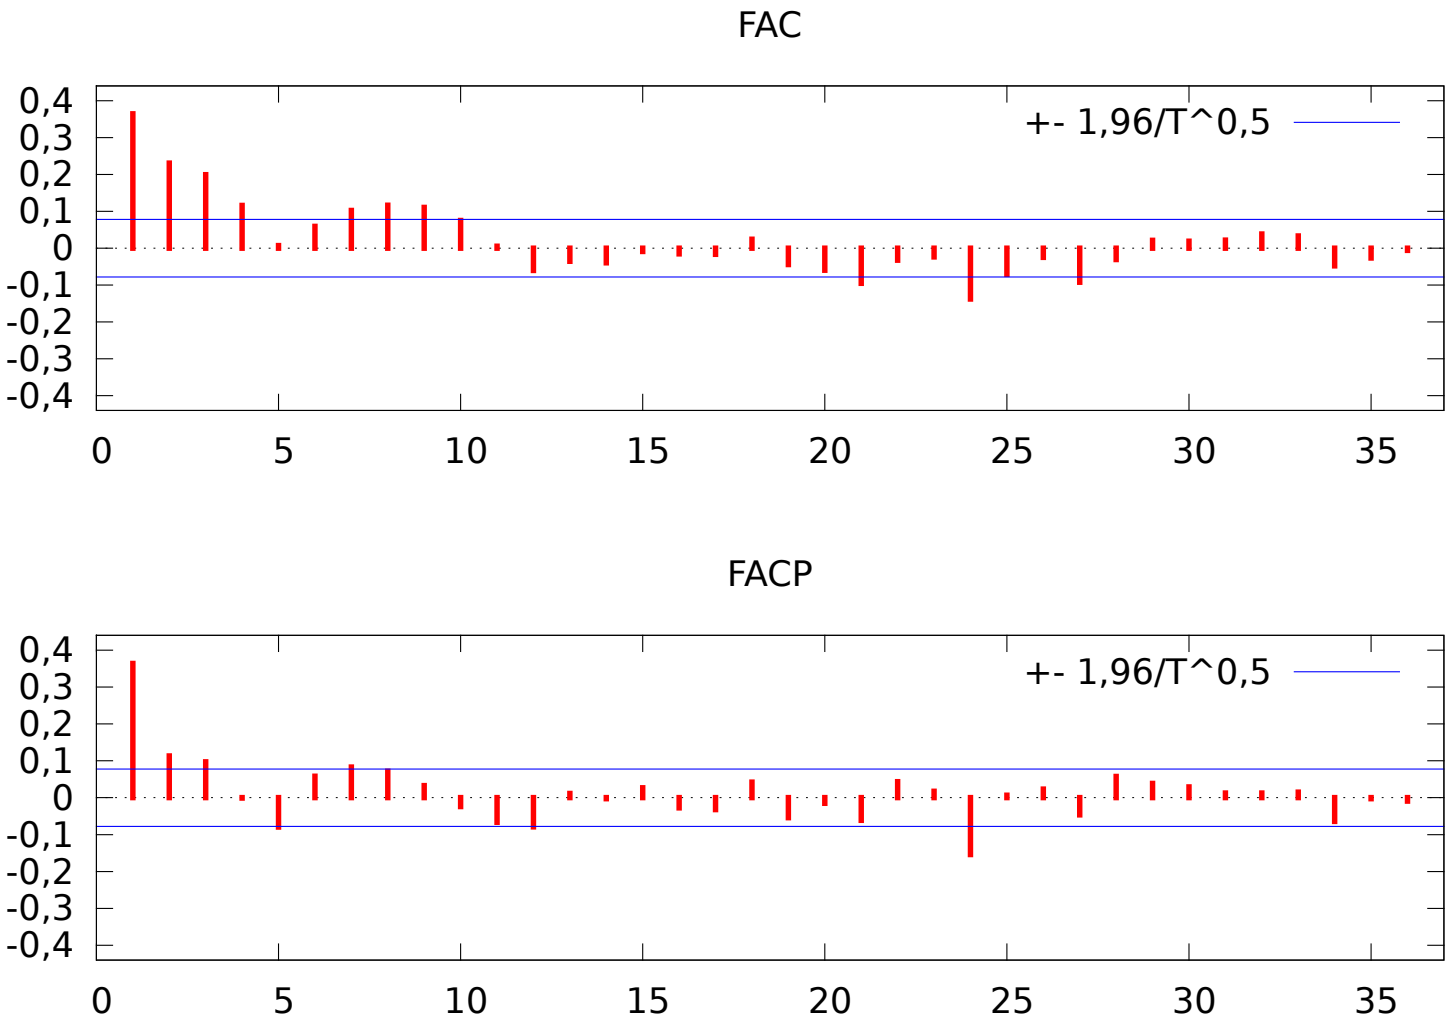
11 Results from a Stock & Watson data base



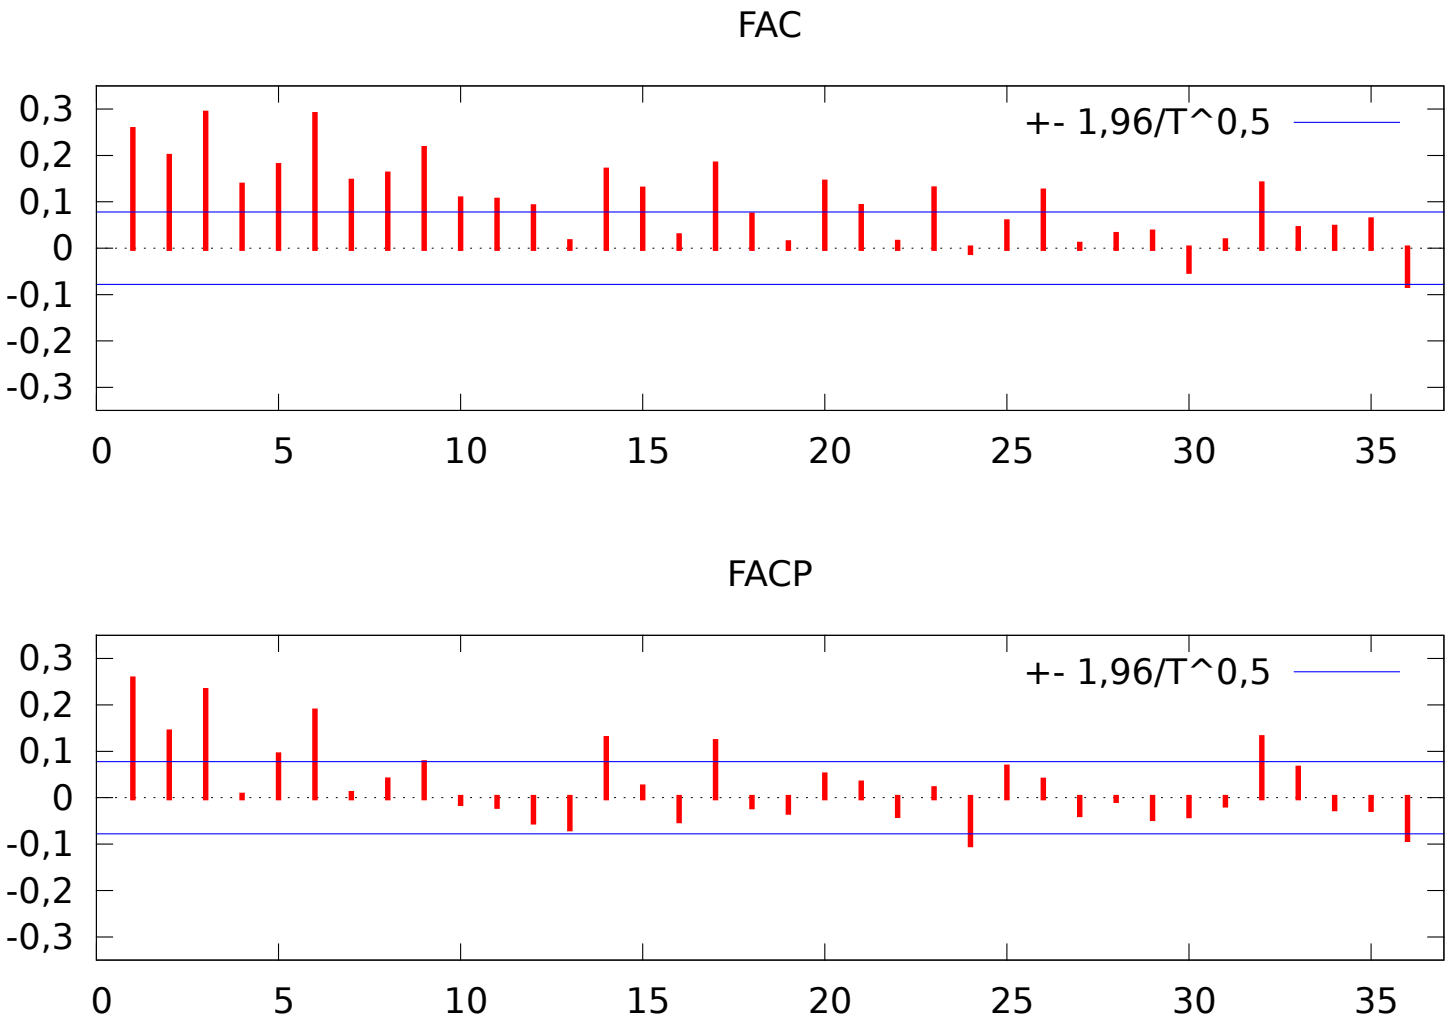
12 Results from a Stock & Watson data base: Housing starts



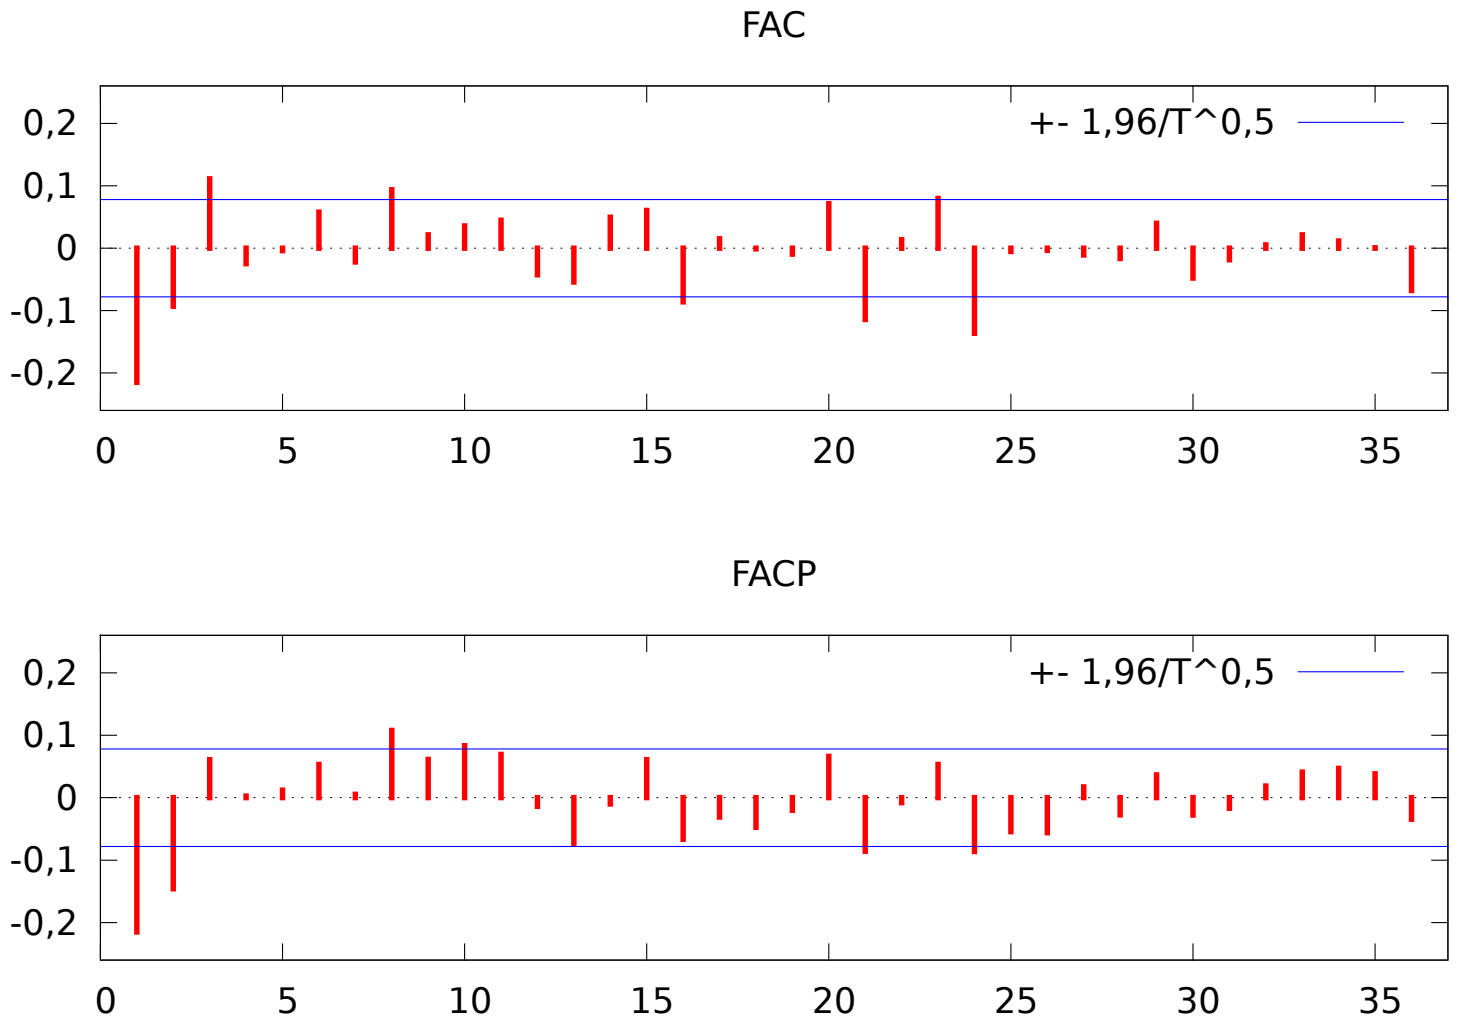
13 Results from a Stock & Watson data base: IPI



14 Results from a Stock & Watson data base: Money supply



15 Results from a Stock & Watson data base: Retail sales



16 Hodrick–Prescott filter

$$y_t = \tau_t + c_t + \epsilon_t$$

Given a positive λ, there is a trend component τ that solves

$$\min_{\tau} \left(\sum_{t=1}^{T} (y_t - \tau_t)^2 + \lambda \sum_{t=2}^{T-1} \left[(\tau_{t+1} - \tau_t) - (\tau_t - \tau_{t-1}) \right]^2 \right)$$

17 Hodrick–Prescott filter

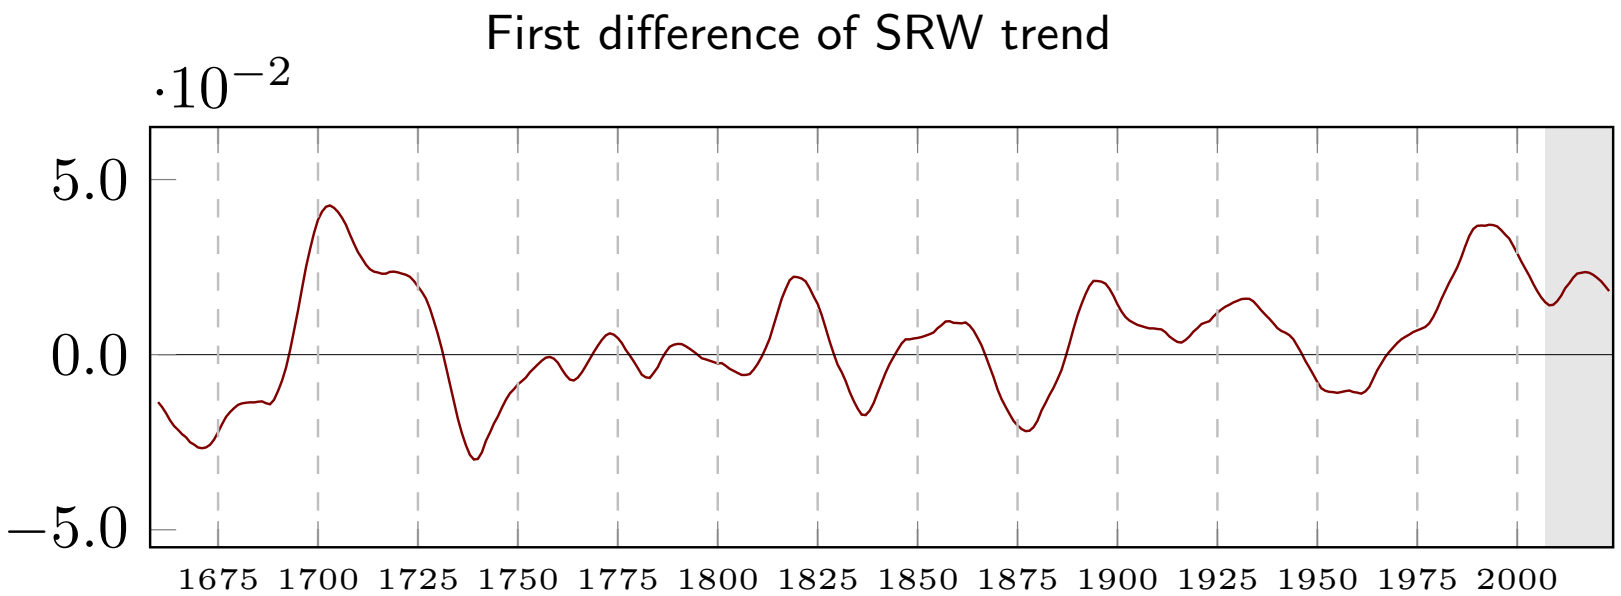
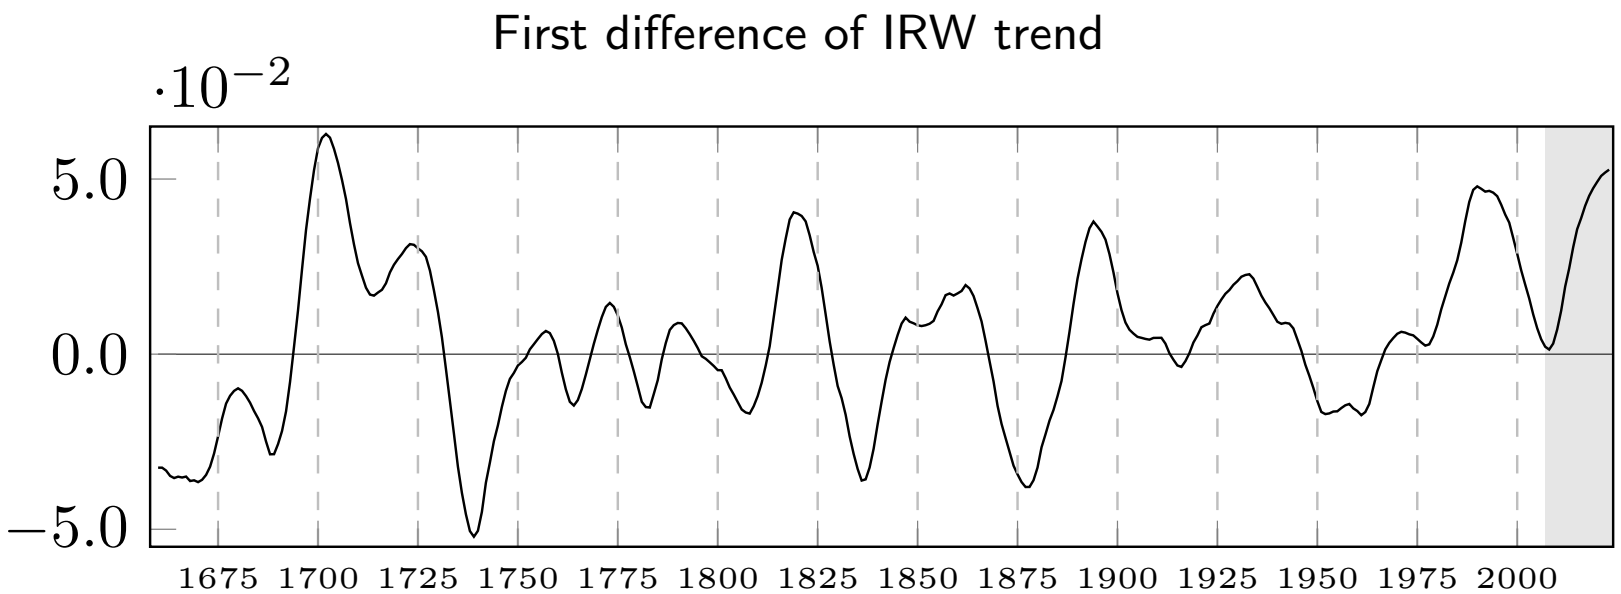
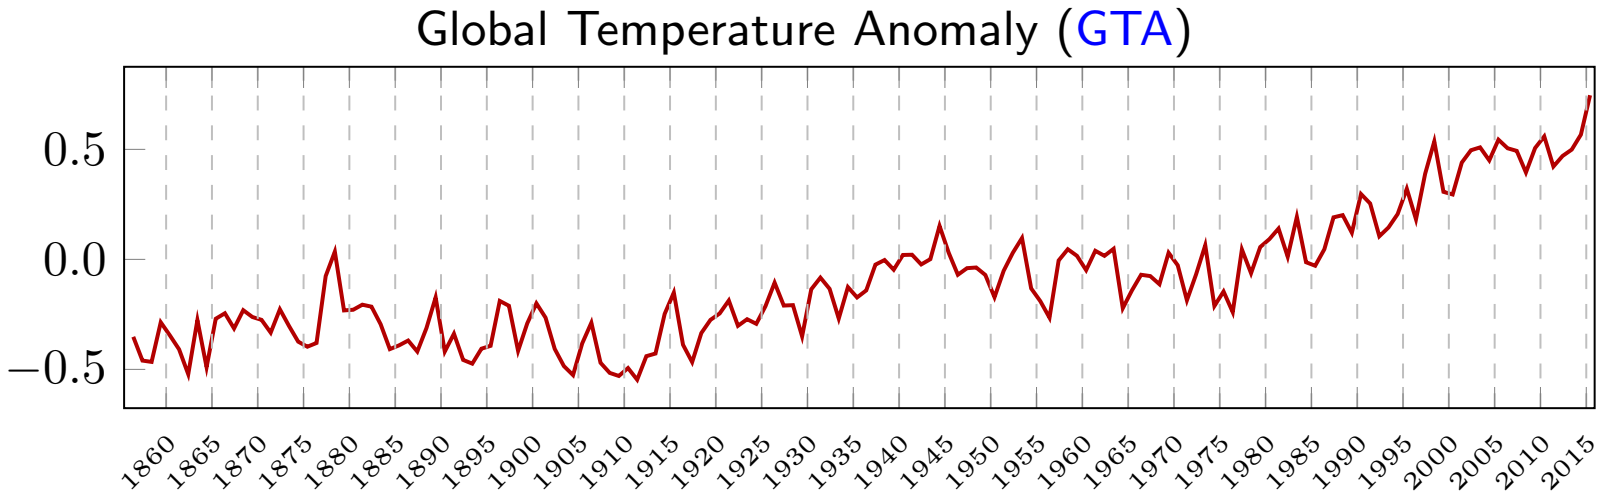
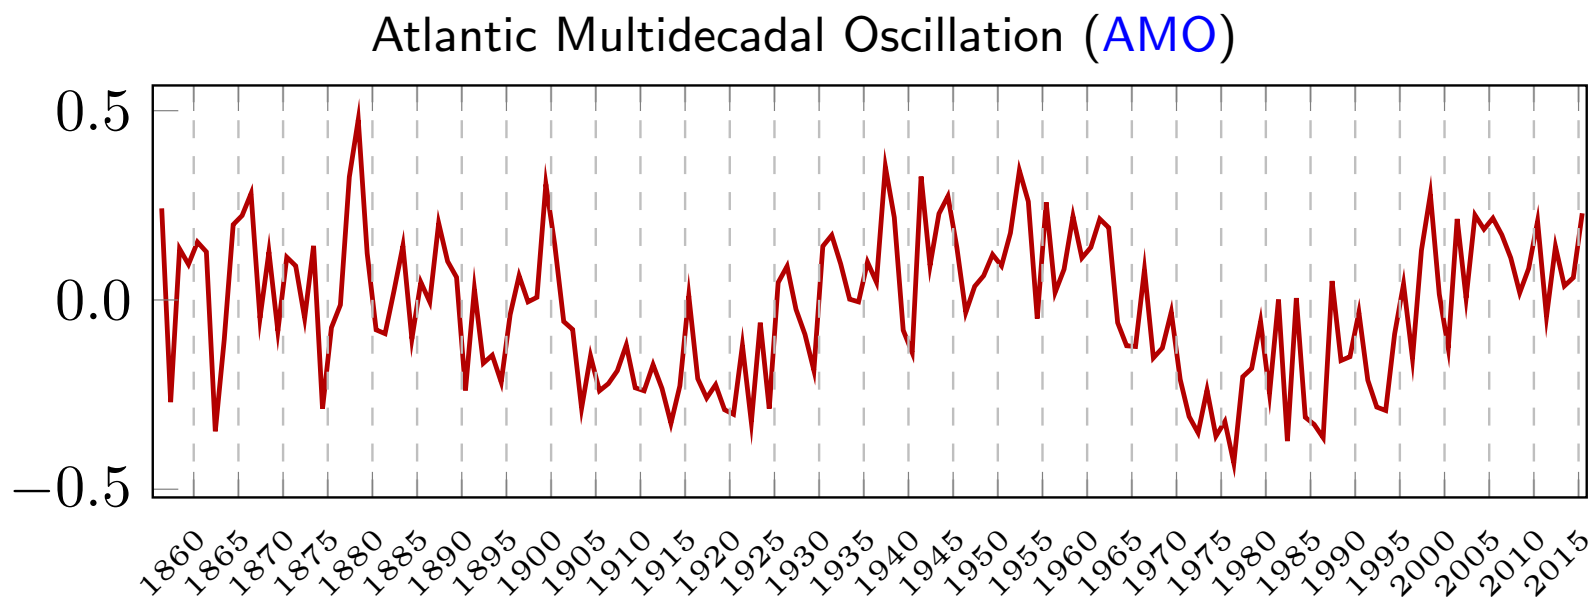
20 The Central England Temperature 1659–2023 (CET)





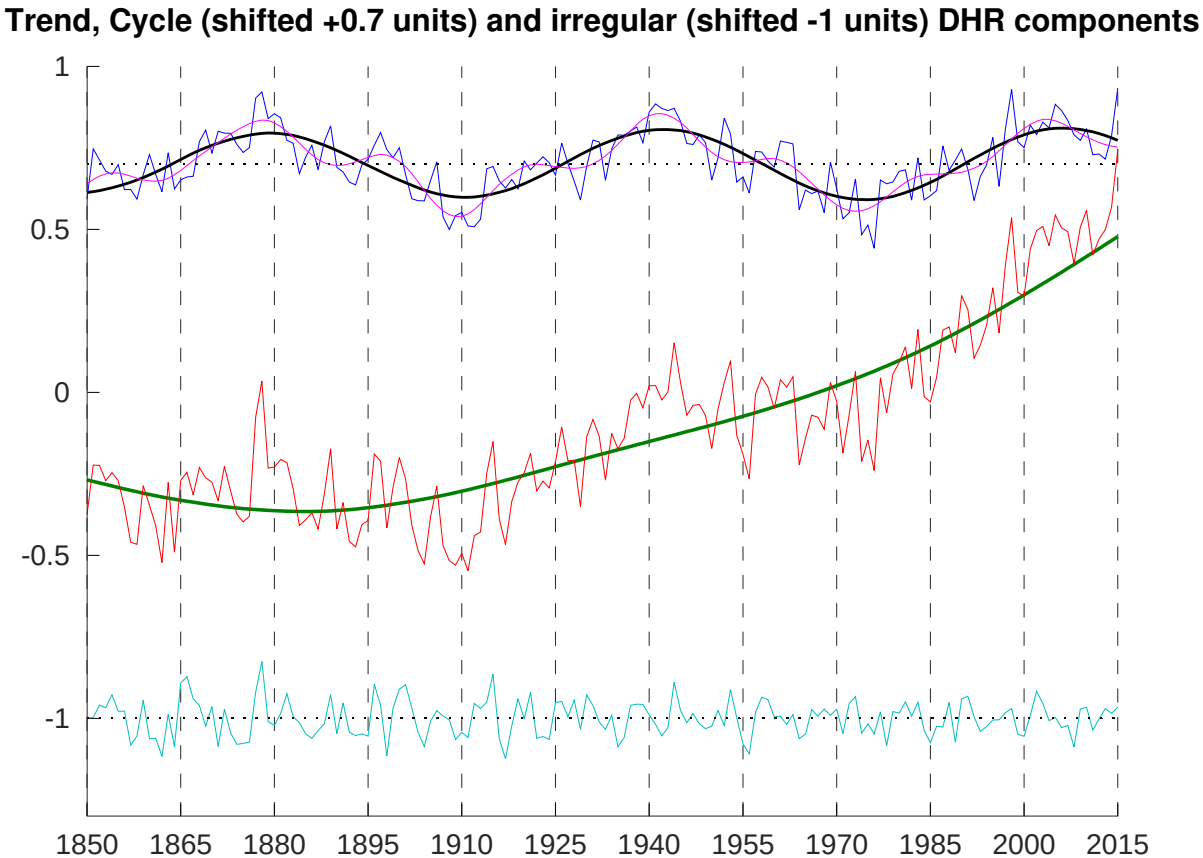
21 Modelling of Global Climate Change





22 Have AMO and GTA a common 63-years cycle?

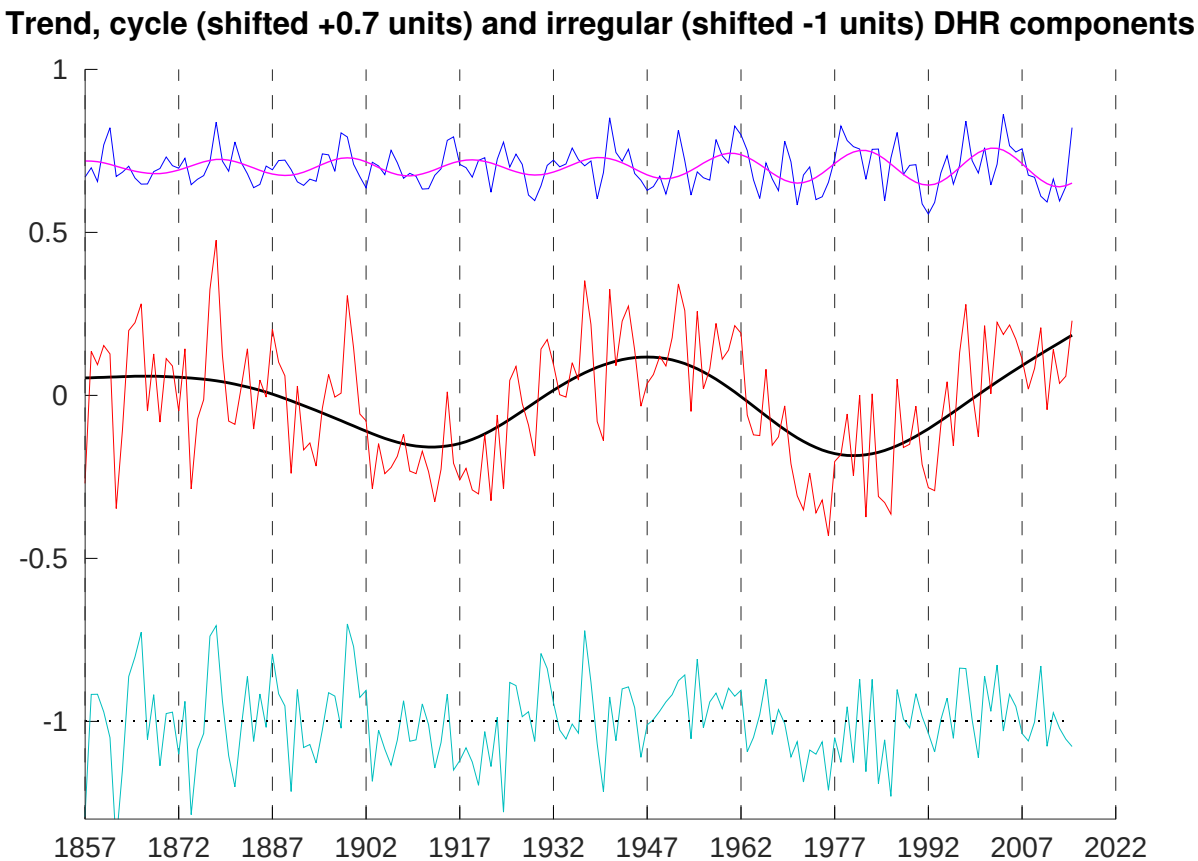
DHR components for GTA



$$GTA = T + S^{63} + S^{21} + \sum(\text{other harmonics}) + Irreg$$

23 Have AMO and GTA a common 63-years cycle?

DHR Trend-cycle component for AMO

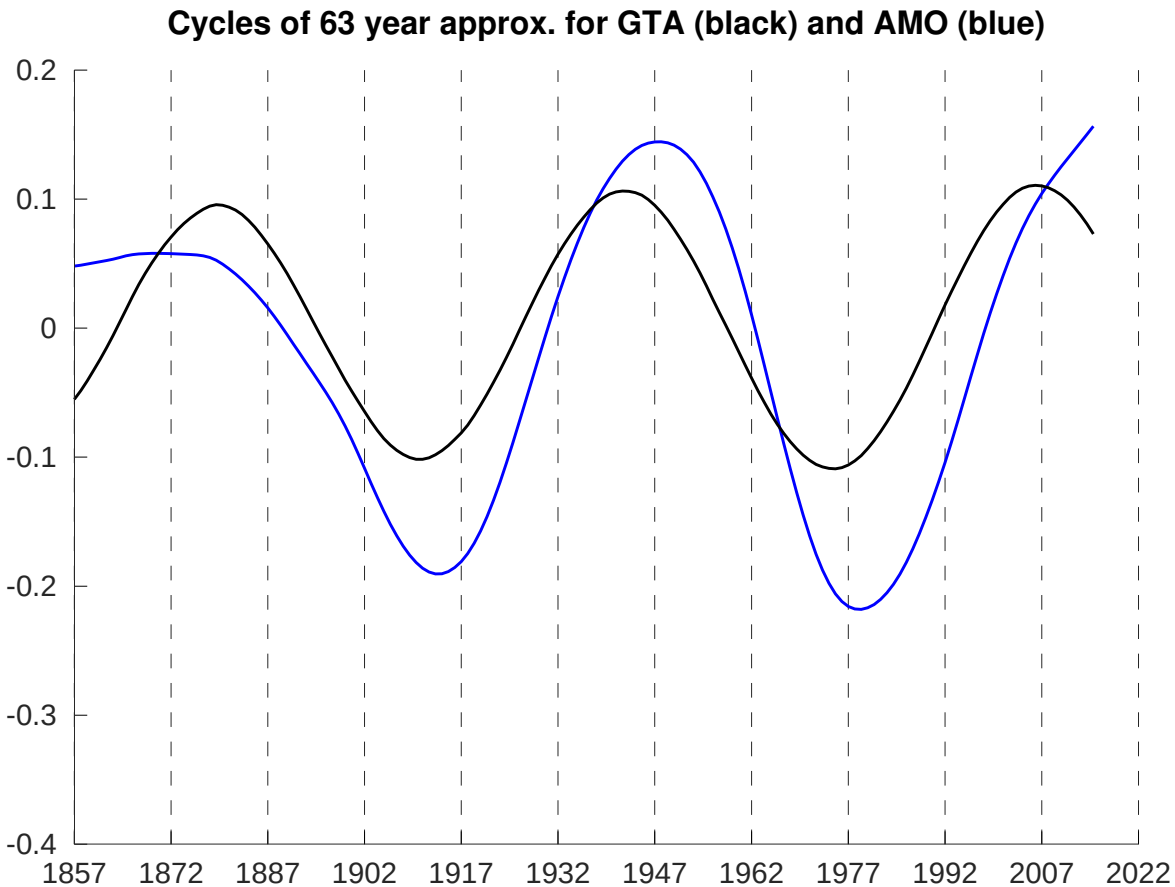


$$AMO = T + S^{21} + \sum(\text{other harmonics}) + Irreg$$

24 Have AMO and GTA a common 63-years cycle?

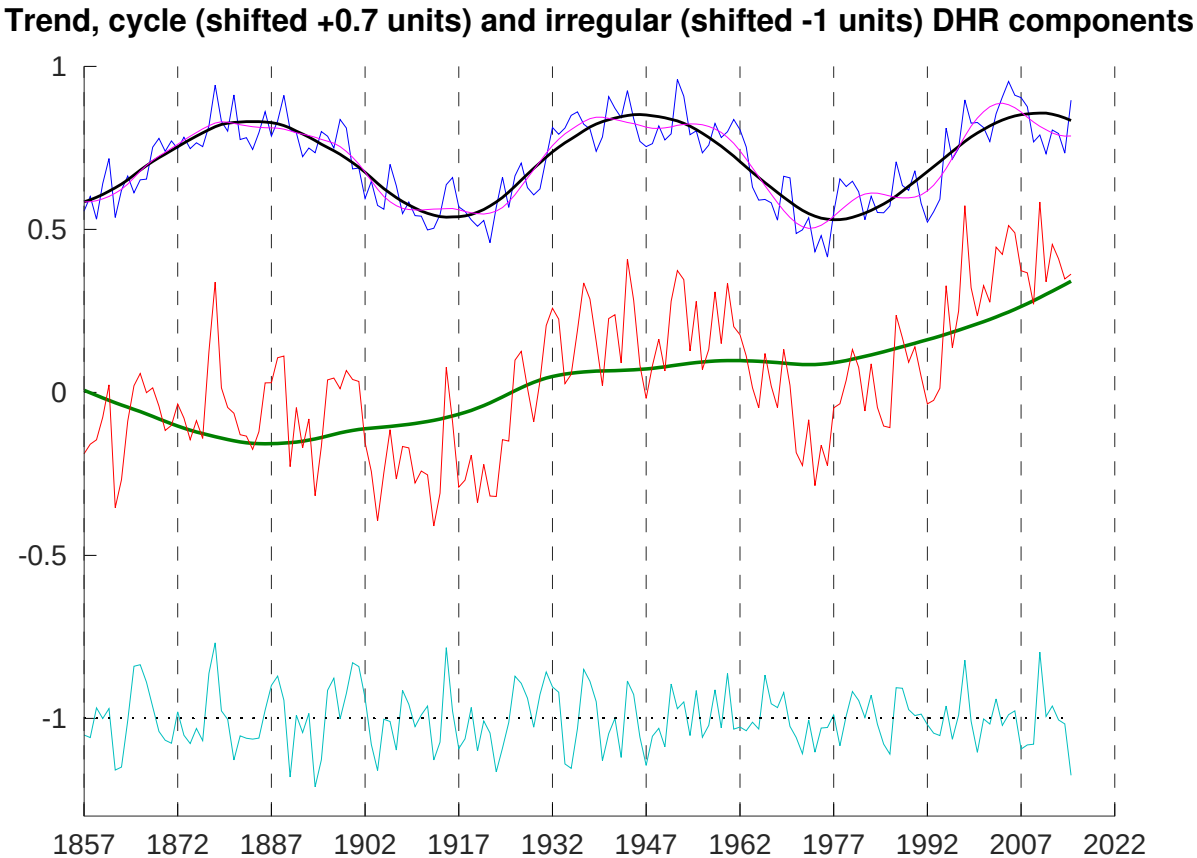
Not clear

GTA has a periodic cycle, but not AMO



25 Have original AMO and GTA a common 63-years cycle?

DHR components for *"original"* AMO data



$$AMO_{\text{with trend}} = T + S^{63} + S^{21} + \sum(\text{other harmonics}) + Irreg$$

26 Have the *"original"* AMO and GTA a common cycle?

They seem to have a common cycle

(as suggested in Professor Young's article)
